Essence Global - Digital Tech - Developer test

Languages that you should make use of:

- PHP
- CSS/SASS
- JavaScript
- HTML

Coding

Assuming the attached data.csv file was imported into a MySQL database, either using bespoke code or a PHP framework of your choice to parse the data and present an aggregated and sortable list of phones by make and model. Clicking a phone should display details of the phone along with any tariffs available.

Your code should display good coding practices, adherence to standards and implementation of design patterns. You may wish to include unit tests and code documentation.

Done

Share us your code via GitHub.

If you have Docker or Vagrant experience, and have time, then you could also produce an environment config for us to run your project locally. **If not dont worry**.
